

HEALTHY, PRODUCTIVE SOILS Checklist for Growers

Managing for soil health is one of the easiest and most effective ways for farmers to increase crop productivity and profitability while improving the environment.

Results are often realized immediately, and last well into the future. Using these four basic principles is the key to improving the health of your soil.

- Keep the soil covered as much as possible
- Disturb the soil as little as possible
- Keep plants growing throughout the year to feed the soil
- Diversify as much as possible using crop rotation and cover crops

Use the checklist on the back of this page to determine if you're using some or all of the core Soil Health Management System farming practices.

It is important to note that not all practices are applicable to all crops. Some operations will benefit from just one soil health practice while others may require additional practices for maximum benefit. But these core practices form the basis of a Soil Health Management System that can help you optimize your inputs, protect against drought, and increase production.

More Information

To learn more about Soil Health Management Systems and the technical and financial assistance available visit **farmers.gov/conserve/soil-health** or contact your local NRCS office. To find your local NRCS office, visit **farmers.gov/service-center-locator**.

WHAT IS IT? WHAT DOES IT DO? **HOW DOES IT HELP?** Conservation Increases nutrient cycling Improves nutrient use efficiency **Crop Rotation** Helps manage plant pests (weeds, Decreases use of pesticides insects, and diseases) Improves water quality A planned sequence of crops Reduces sheet, rill, and Conserves water grown on the same ground over wind erosion a period of time (i.e. the rotation Improves plant production Holds soil moisture cycle). Adds diversity so soil microbes can thrive Increases soil organic matter **Cover Crop** Improves crop production Prevents soil erosion Improves water quality Grasses, legumes, and Conserves soil moisture Conserves water forbs planted for seasonal Increases nutrient cycling Improves nutrient use efficiency vegetative cover. Provides nitrogen for plant use Decreases use of pesticides Suppresses weeds Improves water efficiency to Reduces compaction crops Feeds soil life Reduces residual nutrient loss Improves water infiltration No Till Improves water holding capacity Improves water efficiency of soils Conserves water Limiting soil disturbance to Increases organic matter Improves crop production manage the amount, orientation Reduces soil erosion Improves water quality and distribution of crop and Reduces energy use Saves renewable resources plant residue on the soil surface Decreases compaction Improves air quality year-round. Reduces soil evaporation Increases productivity Reduces soil erosion from wind **Reduced Tillage** Improves water quality and rain Conserves water Using tillage methods where Increases soil moisture for plants Saves renewable resources the soil surface is disturbed but Reduces energy use Improves air quality maintains a high level of crop Increases soil organic matter Improves crop production residue on the surface. Reduces soil evaporation Reduces erosion from wind and rain Improves water quality Mulching Improves plant productivity Moderates soil temperatures Applying plant residues or Increases crop production Increases soil organic matter other suitable materials to Reduces pesticide usage Controls weeds the land surface. Conserves water Conserves soil moisture Improves air quality Reduces dust **Nutrient Management** Increases plant nutrient uptake Improves water quality Improves the physical, chemical, and Improves plant production Manage rate, source, placement, biological properties of the soil Improves air quality and timing of plant nutrients and Budgets, supplies, and conserves soil amendments while reducing nutrients for plant production environmental impacts. Reduces odors and nitrogen emissions Reduces excess nutrient applications Reduces pesticide risks to water quality Improves water quality **Pest Management** Reduces threat of chemicals entering **Conservation System** Improves air quality the air Increases plant pollination A system that combines an Decreases pesticide risk to pollinators Increases plant productivity and other beneficial organisms integrated pest management (IPM) Supports pollinators and other decision-making process with Increases soil organic matter beneficial insects natural resource conservation to Increase soil organism diversity address pest and environmental and activity impacts.
